Table of contents

Query a database
Apply filters to SQL queries
Join tables
Perform calculations

Query a database

The SELECT, FROM, and ORDER BY keywords are used when retrieving information from a database.

FROM

Indicates which table to query; required to perform a query

FROM employees Indicates to query the employees table

ORDER BY

Sequences the records returned by a query based on a specified column or columns

ORDER BY department

Sorts the records in ascending order by the department column; ORDER BY department ASC also sorts the records in ascending order by the department column

ORDER BY city DESC

Sorts the records in descending order by the city column

```
ORDER BY country, city
```

Sorts the records in ascending order by multiple columns; first sorts the output by country, and for records with the same country, sorts them based on city

SELECT

Indicates which columns to return; required to perform a query

```
SELECT employee_id

Returns the employee_id column

SELECT *

Returns all columns in a table
```

Apply filters to SQL queries

WHERE and the other SQL keywords and characters that follow are used when applying filters to SQL queries.

AND

Specifies that both conditions must be met simultaneously in a filter that contains two conditions

```
WHERE region = 5 AND country = 'USA'

Returns all records with a value in the region column of 5 and a value in the country column of 'USA'
```

BETWEEN

Filters for numbers or dates within a range; BETWEEN is followed by the first value to include in the range, the AND operator, and the last value to include in the range

```
WHERE hiredate BETWEEN '2002-01-01' AND '2003-01-01'

Returns all records with a value in the hiredate column that is between '2002-01-01' and '2003-01-01'
```

= (equal to)

Used in filters to return only the records that contain a value in a specified column that is equal to a particular value

```
WHERE birthdate = '1980-05-15'

Returns all records with a value in the birthdate column that equals
'1980-05-15'
```

> (greater than)

Used in filters to return only the records that contain a value in a specified column that is greater than a particular value

```
WHERE birthdate > '1970-01-01'

Returns all records with a value in the birthdate column that is greater than '1970-01-01'
```

>= (greater than or equal to)

Used in filters to return only the records that contain a value in a specified column that is greater than or equal to a particular value

```
WHERE birthdate >= '1965-06-30'

Returns all records with a value in the birthdate column that is greater than or equal to '1965-06-30'
```

< (less than)

Used in filters to return only the records that contain a value in a specified column that is less than a particular value

```
WHERE date < '2023-01-31'
Returns all records with a value in the date column that is less than '2023-01-31'
```

<= (less than or equal to)

Used in filters to return only the records that contain a value in a specified column that is less than or equal to a particular value

```
WHERE date <= '2020-12-31'
```

Returns all records with a value in the date column that is less than or equal to 2020-12-31.

LIKE

Used with WHERE to search for a pattern in a column

```
WHERE title LIKE 'IT%'
```

Returns all records with a value in the title column that matches the pattern of title

```
WHERE state LIKE 'N '
```

Returns all records with a value in the ${\tt state}$ column that matches the pattern of ${\tt 'N_'}$

TOM

Negates a condition

```
WHERE NOT country = 'Mexico'
```

Returns all records with a value in the country column that is not 'Mexico'

<> (not equal to)

Used in filters to return only the records that contain a value in a specified column that is not equal to a particular value; != also used as an operator for not equal to

```
WHERE date <> '2023-02-28'
```

Returns all records with a value in the date column that is not equal to 2023-02-28

! = (not equal to)

Used in filters to return only the records that contain a value in a specified column that is not equal to a particular value; <> also used as an operator for not equal to

```
WHERE date != '2023-05-14'
```

Returns all records with a value in the date column that is not equal to 2023-05-14

OR

Specifies that either condition can be met in a filter that contains two conditions

```
WHERE country = 'Canada' OR country = 'USA'
```

Returns all records with a value in the country column of either 'Canada' or 'USA'

% (percentage sign)

Substitutes for any number of other characters; used as a wildcard in a pattern that follows LIKE

'a%'

Represents a pattern consisting of the letter 'a' followed by zero or more characters

'%a'

Represents a pattern consisting of zero or more characters followed by the letter 'a'

'%a%'

Represents a pattern consisting of the letter 'a' surrounded by zero or more characters on each side

_ (underscore)

Substitutes for one other character; used as a wildcard in a pattern that follows LIKE

```
'a '
```

Represents a pattern consisting of the letter 'a' followed by one character

```
'a '
```

Represents a pattern consisting of the letter 'a' followed by two characters

```
' a'
```

Represents a pattern consisting of one character followed by the letter 'a'

```
' a '
```

Represents a pattern consisting of the letter 'a' surrounded by one character on each side

WHERE

Indicates the condition for a filter; must be used to begin a filter

```
WHERE title = 'IT Staff'
```

Returns all records that contain 'IT Staff' in the title column; WHERE is placed before the condition of title = 'IT Staff' to create the filter

Join tables

The following SQL keywords are used to join tables.

FULL OUTER JOIN

Returns all records from both tables; the column used to join the tables is specified following FULL OUTER JOIN with syntax that includes ON and equal to (=)

```
SELECT *
FROM employees
FULL OUTER JOIN machines ON employees.device_id =
machines.device id;
```

Returns all records from the employees table and machines table; uses the device_id column to join the two tables

INNER JOIN

Returns records matching on a specified column that exists in more than one table; the column used to join the tables is specified following INNER JOIN with syntax that includes ON and equal to (=)

```
SELECT *
FROM employees
INNER JOIN machines ON employees.device_id =
machines.device id;
```

Returns all records that have a value in the device_id column in the employees table that matches a value in the device_id column in the machines table

LEFT JOIN

Returns all the records of the first table, but only returns records of the second table that match on a specified column; the first (or left) table appears directly after the keyword FROM; the column used to join the tables is specified following LEFT JOIN with syntax that includes ON and equal to (=)

```
SELECT *
FROM employees
LEFT JOIN machines ON employees.device_id =
machines.device id;
```

Returns all records from the employees table but only the records from the machines table that have a value in the device_id column that matches a value in the device id column in the employees table

RIGHT JOIN

Returns all of the records of the second table, but only returns records from the first table that match on a specified column; the second (or right) table appears directly after the RIGHT JOIN keyword; the column used to join the tables is specified following RIGHT JOIN with syntax that includes ON and equal to (=)

```
SELECT *
FROM employees
RIGHT JOIN machines ON employees.device_id =
machines.device id;
```

Returns all records from the machines table but only the records from the employees table that have a value in the device_id column that matches a value in the device id column in the machines table

Perform calculations

The following SQL keywords are aggregate functions and are helpful when performing calculations.

AVG

Returns a single number that represents the average of the numerical data in a column; placed after SELECT

```
SELECT AVG(height)
```

Returns the average height from all records that have a value in the height column

COUNT

Returns a single number that represents the number of records returned from a query; placed after SELECT

```
SELECT COUNT (firstname)
```

Returns the number of records that have a value in the firstname column

SUM

Returns a single number that represents the sum of the numerical data in a column; placed after SELECT

```
SELECT SUM(cost)
```

Returns the sum of costs from all records that have a value in the cost column
