**Built-in functions** 

String methods

List methods

Additional syntax for working with strings and lists

Regular expressions

## **Built-in functions**

The following built-in functions are commonly used in Python.

str()

Converts the input object to a string

str(10)

Converts the integer 10 to the string "10"

```
len()
```

Returns the number of elements in an object

```
print(len("security"))
```

Returns and displays 8, the number of characters in the string "security"

## String methods

The following methods can be applied to strings in Python.

```
.upper()
```

Returns a copy of the string in all uppercase letters

```
print("Security".upper())
```

Returns and displays a copy of the string "Security" as "SECURITY"

#### .lower()

Returns a copy of the string in all lowercase letters

```
print("Security".lower())
```

Returns and displays a copy of the string "Security" as "security"

#### .index()

Finds the first occurrence of the input in a string and returns its location

```
print("Security".index("c"))
```

Finds the first occurrence of the character "c" in the string "Security" and returns and displays its index of 2

#### List methods

The following methods can be applied to lists in Python.

```
.insert()
```

Adds an element in a specific position inside the list

```
username_list = ["elarson", "fgarcia", "tshah"]
username_list.insert(2,"wjaffrey")
Adds the element "wjaffrey" at index 2 to the username_list; the list
becomes ["elarson", "fgarcia", "wjaffrey", "tshah"]
```

#### .remove()

Removes the first occurrence of a specific element inside a list

```
username_list = ["elarson", "bmoreno", "wjaffrey", "tshah"]
username_list.remove("elarson")
Removes the element "elarson" from the username_list; the list becomes
["fgarcia", "wjaffrey", "tshah"]
```

#### .append()

Adds input to the end of a list

```
username_list = ["bmoreno", "wjaffrey", "tshah"]
username_list.append("btang")
Adds the element "btang" to the end of the username_list; the list
becomes ["fgarcia", "wjaffrey", "tshah", "btang"]
```

#### .index()

Finds the first occurrence of an element in a list and returns its index

```
username_list = ["bmoreno", "wjaffrey", "tshah", "btang"]
print(username_list.index("tshah"))
```

Finds the first occurrence of the element "tshah" in the username\_list and returns and displays its index of 2

## Additional syntax for working with strings and lists

The following syntax is useful when working with strings and lists.

### + (concatenation)

Combines two strings or lists together

```
device_id = "IT"+"nwp12"
Combines the string "IT" with the string "nwp12" and assigns the combined
string of "ITnwp12" to the variable device_id

users = ["elarson", "bmoreno"] + ["tshah", "btang"]
Combines the list ["elarson", "bmoreno"] with the list ["tshah",
"btang"] and assigns the combined list of ["elarson", "bmoreno",
"tshah", "btang"] to the variable users
```

## [] (bracket notation)

Uses indices to extract parts of a string or list

```
print("h32rb17"[0])
Extracts the character at index 0, which is ("h"), from the string "h32rb17"

print("h32rb17"[0:3])
Extracts the slice [0:3], which is ("h32"), from the string "h32rb17"; the first index in the slice (0) is included in the slice but the second index in the slice (3) is excluded
```

```
username_list = ["elarson", "fgarcia", "tshah"]
print(username_list[2])
```

Extracts the element at index 2, which is ("tshah"), from the username\_list

## Regular expressions

The following re module function and regular expression symbols are useful when searching for patterns in strings.

```
re.findall()
```

Returns a list of matches to a regular expression

```
import re
re.findall("a53", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern "a53" in the string "a53-32c .E"; returns the list ["a53"]

\w

Matches with any alphanumeric character; also matches with the underscore ( )

```
import re
re.findall("\w", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern " $\w$ " in the string "a53-32c .E"; matches to any alphanumeric character and returns the list ["a", "5", "3", "3", "2", "c", "E"]

Matches to all characters, including symbols

```
import re
re.findall(".", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern "." in the string "a53-32c .E"; matches to all characters and returns the list ["a", "5", "3", "-", "3", "2", "c", " ", ".", "E"]

\d

Matches to all single digits

```
import re
re.findall("\d", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern "\d" in the string "a53-32c"; matches to all single digits and returns the list ["5", "3", "3", "2"]

\s

Matches to all single spaces

```
import re
re.findall("\d", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern " $\s$ " in the string "a53-32c"; matches to all single spaces and returns the list [" "]

١.

Matches to the period character

```
import re
re.findall("\.", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern "\." in the string "a53-32c"; matches to all instances of the period character and returns the list ["."]

+

Represents one or more occurrences of a specific character

```
import re
re.findall("\w+", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern " $\wedge w$ " in the string "a53-32c"; matches to one or more occurrences of any alphanumeric character and returns the list ["a53", "32c", "E"]

Represents, zero, one or more occurrences of a specific character

```
import re
re.findall("\w*", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern " $\w^*$ " in the string "a53-32c"; matches to one or more occurrences of any alphanumeric character and returns the list ["a53", " ", "32c", " ", " ", "E"]

{ }

Represents a specified number of occurrences of a specific character; the number is specified within the curly brackets

```
import re
re.findall("\w{3}", "a53-32c .E")
```

Returns a list of matches to the regular expression pattern " $\w{3}$ " in the string "a53-32c"; matches to exactly three occurrences of any alphanumeric character and returns the list ["a53", "32c"]
